

Hello world, Credit Suisse,

DevOps, a term that has been going around the world a lot lately and pushed many software houses to implement and execute the concept that came forth after the struggle to keep the software to be updated and pushed to the production regularly. This term, which once I have read about it made me curious to learn more and further develop the journey.

I am a software engineer student who loves to seek finding ways to develop a system that could not only satisfy a customer but also could be defined as a team effort product. The culture which the DevOps is bringing forth; communication between the developers and the IT specialist made me realize how amazing this is.

I am a student in his final years and work currently in a small startup company in which I am currently handling the backend development while using DevOps tools such as docker and GitLab. I would like to go further in learning DevOps on a larger scale and fortunately, I came across to your internship position in Java DevOps.

With previous projects I have worked with using Mongo DB and PostgreSQL at work, my curiosity and driven personality to learn new things, I am confident to be able to contribute as part of the team.

I would like to thank you for taking your time to read my cover letter and would like to wish I would be able to hear further from you.

Best regards,

Khaalid Subaan
